Methane response at 1000 K: factorization, selection, exact collapse
q = ln K(T) - delta_nu ln(P/P0); pressure changes q, not ideal-gas K
A/B edges: dq / d ln(T or P), then d ln(n_CH4) / dq; C: d ln(n_CH4) / d ln(T or P)
Blue positive; orange dashed negative. Separate views; do not add direct and factorized edges.
